# Understanding Data Part 3 **Extracting Information from Data**

#### Information

**Information** is the collection of facts and patterns extracted from data. Data provide opportunities for identifying trends, making connections, and addressing problems.

The size of a data set affects the amount of information that can be extracted from it. A popular subfield of computer science is data science where large datasets are processed and analyzed.

Large data sets are difficult to process using a single computer and may require parallel or distributed systems. **Scalability** of systems is an important consideration when working with data sets, as the computational capacity of a system affects how data sets can be processed and stored.

**Parallel computing** uses a single computer with multiple processors. **Distributed** computing uses multiple computing devices to process those tasks.

#### Information

Programs can be used to process data to acquire information.

Programs such as spreadsheets(for example, Excel) help efficiently organize and find trends in information. Excel can process tabular data or 2D data with mixed datatypes.

A powerful alternative is Python's pandas library. We will explore this library and see how it helps us:

- gain insight and knowledge that are obtained from translating and transforming digitally represented information.
- see patterns when data are transformed
- filter, modify, combine and compare data
- visualize data through charts, graphs, tables and other visualizations

We will use Jupyter Notebook(Lab) for all code in this lecture slides.

We'll explore pandas using Jupyter Lab by looking at a movies dataset: IMDB's Top 1000 movies. The "imdb\_1000.csv" comma-separated values file is a text file that contains information about these movies.

```
imdb_1000.csv
star_rating,title,content_rating,genre,duration,actors_list
9.3, The Shawshank Redemption, R, Crime, 142, "['Tim Robbins', 'Morgan Freeman', 'Bob Gunton']"
9.2, The Godfather, R, Crime, 175, "['Marlon Brando', 'Al Pacino', 'James Caan']"
9.1, The Godfather: Part II,R,Crime,200,"['Al Pacino', 'Robert De Niro', 'Robert Duvall']"
9, The Dark Knight, PG-13, Action, 152, "['Christian Bale', 'Heath Ledger', 'Aaron Eckhart']"
8.9, Pulp Fiction, R, Crime, 154, "['John Travolta', 'Uma Thurman', 'Samuel L. Jackson']"
8.9,12 Angry Men,NOT RATED,Drama,96,"['Henry Fonda', 'Lee J. Cobb', 'Martin Balsam']"
8.9, "The Good, the Bad and the Ugly", NOT RATED, Western, 161, "['Clint Eastwood', 'Eli Wallach', 'Lee Van Cleef']"
8.9, The Lord of the Rings: The Return of the King, PG-13, Adventure, 201, "['Elijah Wood', 'Viggo Mortensen', 'Ian McKellen']"
8.9, Schindler's List, R, Biography, 195, "['Liam Neeson', 'Ralph Fiennes', 'Ben Kingsley']"
8.9, Fight Club, R, Drama, 139, "['Brad Pitt', 'Edward Norton', 'Helena Bonham Carter']"
8.8, The Lord of the Rings: The Fellowship of the Ring, PG-13, Adventure, 178, "['Elijah Wood', 'Ian McKellen', 'Orlando Bloom']"
8.8, Inception, PG-13, Action, 148, "['Leonardo DiCaprio', 'Joseph Gordon-Levitt', 'Ellen Page']"
8.8, Star Wars: Episode V - The Empire Strikes Back, PG, Action, 124, "['Mark Hamill', 'Harrison Ford', 'Carrie Fisher']"
8.8, Forrest Gump, PG-13, Drama, 142, "['Tom Hanks', 'Robin Wright', 'Gary Sinise']"
8.8, The Lord of the Rings: The Two Towers, PG-13, Adventure, 179, "['Elijah Wood', 'Ian McKellen', 'Viggo Mortensen']"
8.7, Interstellar, PG-13, Adventure, 169, "['Matthew McConaughey', 'Anne Hathaway', 'Jessica Chastain']"
8.7,One Flew Over the Cuckoo's Nest,R,Drama,133,"['Jack Nicholson', 'Louise Fletcher', 'Michael Berryman']"

Pandas can read in a csv file and store it as a dataframe, a 2D data structure.

```
import numpy as np
In [1]:
               import pandas as pd
In [2]:
               movies = pd.read csv("imdb 1000.csv")
              movies.head() 	Top five rows of the dataframe.
     [3]:
Out[3]:
             star_rating
                                          title content_rating
                                                           genre duration
                                                                                                      actors list
           0
                       The Shawshank Redemption
                                                           Crime
                                                                          ['Tim Robbins', 'Morgan Freeman', 'Bob Gunton']
                   9.2
                                  The Godfather
                                                           Crime
                                                                      175
                                                                              ['Marlon Brando', 'Al Pacino', 'James Caan']
                   9.1
                             The Godfather: Part II
                                                         R Crime
                                                                      200
                                                                             ['Al Pacino', 'Robert De Niro', 'Robert Duvall']
                   9.0
                                 The Dark Knight
                                                     PG-13 Action
                                                                      152
                                                                            ['Christian Bale', 'Heath Ledger', 'Aaron Eckh...
                   8.9
                                    Pulp Fiction
                                                                           ['John Travolta', 'Uma Thurman', 'Samuel L. Ja...
                                                           Crime
```

#### **Dataframe**

The movies data structure in the previous slides is a **dataframe**. A dataframe is an enhanced two-dimensional data structure. You can think of it as a dictionary where the keys are the column names and the values are column values. Each column is called a Series.

## Accessing Columns of a Dataframe

The movies data structure in the previous slides is a **Dataframe**. A Dataframe is an enhanced two-dimensional data structure. You can think of it as a dictionary where the keys are the column names and the values are column values. Each column is called a **Series**.

```
In [4]: movies["genre"]
Out[4]:
                    Crime
                    Crime
                               You can select a column by using [] notation and
                    Crime
                               specifying the column name as a string.
                  Action
                    Crime
                               This displays the "genre" Series.
        974
                  Comedy
        975
               Adventure
        976
                  Action
        977
                  Horror
                    Crime
        978
        Name: genre, Length: 979, dtype: object
```

#### Accessing Columns of a Dataframe

Here's another column in this dataframe called "title".

```
In [5]:
        movies["title"]
Out[5]:
                                        The Shawshank Redemption
                                                    The Godfather
                                          The Godfather: Part II
        3
                                                  The Dark Knight
        4
                                                     Pulp Fiction
        974
                                                          Tootsie
        975
                                     Back to the Future Part III
        976
                Master and Commander: The Far Side of the World
        977
                                                      Poltergeist
                                                      Wall Street
        978
```

## **Analyzing Data**

For categorical data like movies genre, the method value\_counts() returns a columns(Series) containing counts of unique values.

For example, suppose I am interested in investigating to see which of the movies genre is most popular in the top movies rated on IMDB.

Patterns can emerge when data are transformed using programs.

# I genre is Drama!

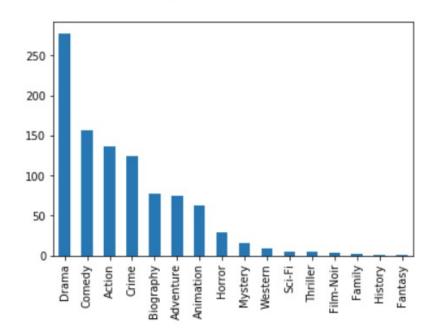

```
In [5]: movies["genre"].value counts()
Out[5]:
                       278
        Drama
        Comedy
                       156
         Action
                       136
        Crime
                      124
        Biography
                        77
         Adventure
                        75
         Animation
                        62
                        29
         Horror
        Mystery
                        16
        Western
         Sci-Fi
         Thriller
         Film-Noir
        Family
        History
        Fantasy
         Name: genre, dtype: int64
```

# **Plotting Data**

Tables, charts, diagrams, text, and other visual tools can be used to communicate insight and knowledge gained from data.

The table of counts of unique values can be visually presented using pandas' plot function. We can specify the kind of graph with the "kind" optional parameter.

```
In [6]: movies["genre"].value_counts().plot(kind="bar")
Out[6]: <matplotlib.axes._subplots.AxesSubplot at 0x110857978>
```

The columns of a dataframe share the same row "index". In this example, the index is **positional**.

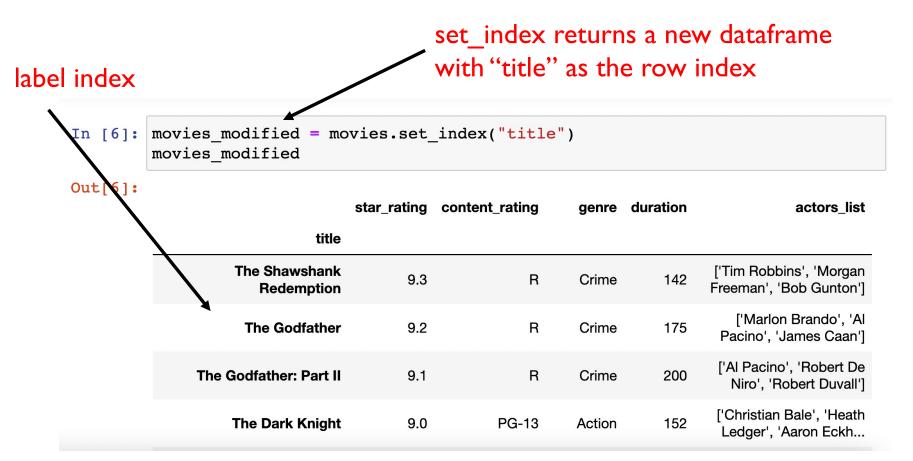

#### Positional index

	star_rating	title	content_rating	genre	duration	actors_list
0	9.3	The Shawshank Redemption	R	Crime	142	['Tim Robbins', 'Morgan Freeman', 'Bob Gunton']
1	9.2	The Godfather	R	Crime	175	['Marlon Brando', 'Al Pacino', 'James Caan']
2	9.1	The Godfather: Part II	R	Crime	200	['Al Pacino', 'Robert De Niro', 'Robert Duvall']
3	9.0	The Dark Knight	PG-13	Action	152	['Christian Bale', 'Heath Ledger', 'Aaron Eckh
4	8.9	Pulp Fiction	R	Crime	154	['John Travolta', 'Uma Thurman', 'Samuel L. Ja

If the indexing is positional, .iloc[] notation allows us to access rows of a dataframe. For example, to get the top 4 rows of the dataframe:

It is often to useful to index by **labels** instead of positional. For example, we may prefer to index the movies based the title of the movie instead of integers.

If the indexing is by labels, .loc[] notation allows us to access rows of a dataframe.

For example:

When accessing rows, by default, pandas give us all columns.

In [9]: mc	<pre>movies_modified.loc["The Godfather":"The Dark Knight"]</pre>										
Out[9]:		star_rating	content_rating	genre	duration	actors_list					
	title										
	The Godfather	9.2	R	Crime	175	['Marlon Brando', 'Al Pacino', 'James Caan']					
Т	The Godfather: Part II	9.1	R	Crime	200	['Al Pacino', 'Robert De Niro', 'Robert Duvall']					
	The Dark Knight	9.0	PG-13	Action	152	['Christian Bale', 'Heath Ledger', 'Aaron Eckh					

Note: Unlike slicing in general as well as slicing with integer index(iloc), slicing with loc includes the endpoint. Above, it includes the Dark Knight.

# Filtering Data

Some processes can be used to extract information. For example, data filtering systems are important tools for finding information and recognizing patterns in data.

What if I want to filter my data and only want to look at movies with at least 9.0 rating? You can use the .loc[] notation and insert a filtering boolean condition.

returns all rows satisfying this boolean.

Search tools are useful for efficiently finding information.

For example, what if I want to watch a highly rated movies that starred Christian Bale? Series.str.contains("string") can be used here.

```
In [8]: movies.loc[movies["actors_list"].str.contains("Christian Bale")]
Out[8]:
```

	star_rating	title	content_rating	genre	duration	actors_list
3	9.0	The Dark Knight	PG-13	Action	152	['Christian Bale', 'Heath Ledger', 'Aaron Eckh
43	8.5	The Dark Knight Rises	PG-13	Action	165	['Christian Bale', 'Tom Hardy', 'Anne Hathaway']
53	8.5	The Prestige	PG-13	Drama	130	['Christian Bale', 'Hugh Jackman', 'Scarlett J
113	8.3	Batman Begins	PG-13	Action	140	['Christian Bale', 'Michael Caine', 'Ken Watan
446	7.9	The Fighter	R	Biography	116	['Mark Wahlberg', 'Christian Bale', 'Amy Adams']
504	7.8	Empire of the Sun	PG	Drama	153	['Christian Bale', 'John Malkovich', 'Miranda
555	7.8	3:10 to Yuma	R	Adventure	122	['Russell Crowe', 'Christian Bale', 'Ben Foster']
589	7.7	The Machinist	R	Drama	101	['Christian Bale', 'Jennifer Jason Leigh', 'Ai
702	7.6	Jin ling shi san chai	R	Drama	146	['Christian Bale', 'Ni Ni', 'Xinyi Zhang']
732	7.6	American Psycho	R	Crime	102	['Christian Bale', 'Justin Theroux', 'Josh Luc
815	7.6	Equilibrium	R	Action	107	['Christian Bale', 'Sean Bean', 'Emily Watson']

#### Cleaning Data

Data sets pose challenges regardless of size, such as:

- the need to clean data
- incomplete data
- invalid data
- the need to combine data sources

Depending on how data were collected, they may not be uniform. For example, if users enter data into an open field, the way they choose to abbreviate, spell, or capitalize something may vary from user to user.

**Cleaning data** is a process that makes the data uniform without changing their meaning (e.g., replacing all equivalent abbreviations, spellings, and capitalizations with the same word).

Problems of bias are often created by the type or source of data being collected. Bias is not eliminated by simply collecting more data.

#### Titanic Dataset Example

On April 15, 1912, during her maiden voyage, the Titanic sank after colliding with an iceberg, killing 1502 out of 2224(32% survival rate) passengers and crew.

```
In [1]: import numpy as np
import pandas as pd
titanic = pd.read_csv("titanic_train.csv")
titanic.head()
```

#### Out[1]:

	Passengerld	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked
0	1	0	3	Braund, Mr. Owen Harris	male	22.0	1	0	A/5 21171	7.2500	NaN	s
1	2	1	1	Cumings, Mrs. John Bradley (Florence Briggs Th	female	38.0	1	0	PC 17599	71.2833	C85	С
2	3	1	3	Heikkinen, Miss. Laina	female	26.0	0	0	STON/O2. 3101282	7.9250	NaN	s
3	4	1	1	Futrelle, Mrs. Jacques Heath (Lily May Peel)	female	35.0	1	0	113803	53.1000	C123	S
4	5	0	3	Allen, Mr. William Henry	male	35.0	0	0	373450	8.0500	NaN	S

#### Titanic Dataset Example

Calling the info() method on the dataframe, we can see that this dataset contains incomplete data. For example, Age has only 714 entries(out of 891) and Cabin only has 204 entries(out of 891).

```
In [2]: titanic.info()
       <class 'pandas.core.frame.DataFrame'>
       RangeIndex: 891 entries, 0 to 890
       Data columns (total 12 columns):
       PassengerId
                  891 non-null int64
       Survived
                  891 non-null int64
                 891 non-null int64
       Pclass
       Name 891 non-null object
                 891 non-null object
       Sex
                   714 non-null float64
       Age
                 891 non-null int64
       SibSp
       Parch 891 non-null int64
                  891 non-null object
       Ticket
                   891 non-null float64
       Fare
       Cabin
                 204 non-null object
       Embarked
                    889 non-null object
       dtypes: float64(2), int64(5), object(5)
       memory usage: 83.7+ KB
```

## Cleaning Data

If we are trying to create a model that predicts which passengers survived the Titanic shipwreck. To get a good model, we may clean our data by:

- dropping features that contain too many blank or null values(Cabin)
- dropping features that may not have high correlation to our prediction(Name, PassengerId, Ticket)

```
In [3]: titanic.drop(["Name", "Ticket", "PassengerId", "Cabin"], inplace=True, axis=1)
    titanic.head()
```

#### Out[3]:

	Survived	Pclass	Sex	Age	SibSp	Parch	Fare	Embarked
0	0	3	male	22.0	1	0	7.2500	s
1	1	1	female	38.0	1	0	71.2833	С
2	1	3	female	26.0	0	0	7.9250	s
3	1	1	female	35.0	1	0	53.1000	S
4	0	3	male	35.0	0	0	8.0500	s

Note: We are down to 8 columns instead of 12.

# **Extracting Information**

One of the reasons that the shipwreck led to such loss of life was that there were not enough lifeboats for the passengers and crew.

Although there was some element of luck involved in surviving the sinking, some groups of people were more likely to survive than others, such as women, children, and the upper-class.

For example, we can call the groupby() method to group the passengers based on the column Pclass(I = upper-class, 2 = middle-class, 3 = lower-class) and look at their survivor rate.

#### **Data**

Digitally processed data may show correlation between variables. A correlation found in data does not necessarily indicate that a causal relationship exists.

Additional research is needed to understand the exact nature of the relationship.

Often, a single source does not contain the data needed to draw a conclusion. It may be necessary to combine data from a variety of sources to formulate a conclusion.

Combining data sources, clustering data, and classifying data are parts of the process of using programs to gain insight and knowledge from data.
